Reminder on the regulations

The " *Choice of brand* " feature allows merchants to comply with European regulation 215/751 of 29 April 2015 relating to interchange fees for payment transactions linked to a card, generally called "MiFID regulation" (*Merchant Interchange Fees*).

One of the objectives of this regulation is to remove the monopoly of local schemes by letting the buyer choose the brand used during payment.

Merchants have been required to comply with this regulation since June 9, 2016.

Article relating to the regulations on [the FEVAD website](#).

Trademark principles

Cards issued by French banks are largely attached to the French *Cartes Bancaires* (CB) network but also to an international network (Electron, Maestro, Mastercard, Visa, etc.). This is what allows the cardholder to use his card abroad. There are other local networks that issue co-badged cards. In Belgium, banks issue cards that belong to both the Bancontact network and also Maestro or Visa.

i Note : there are non-co-badged cards for which the regulations do not apply.

As soon as a business accepts cards from different networks, it must allow buyers to select the brand they prefer.

If, for example, the merchant accepts CB, Mastercard and Visa cards, then the co-badged CB / Visa and CB / Mastercard cards are concerned, and the merchant cannot impose his choice. On the other hand, he can select his preferred network, which will be used if the buyer does not wish to change.

i Note : the network through which transactions pass can influence the amount of commissions applied by the acquirer. We invite you to contact your purchaser for more information.

Implementation

At the level of each Monext Online contract, the merchant can configure:

- The **activation of branding** : This option must be enabled to comply with MiFID regulations;
- The choice of **default network** for each type of card (debit, credit, business). This makes it possible to choose on which network the transaction will pass when the buyer does not make an explicit choice.

If the option is enabled, the buyer's choice always takes precedence over the merchant's default.

Wallet

Regarding the **Wallet** , the network used by the 1st transaction determines that used for the following transactions.

When activated on a contract, the "brand choice" functionality applies to transactions initiated in **WebPayment** (**Web mode**, payment page and / or registration of a card in the **Wallet**).

Backoffice

The manual entry of transaction in the [backoffice](#) allows the choice of the brand.

For the other modes, the collection of the choice from the customer is [the responsibility of the merchant](#) :

- **DirectPayment** : payment or payment by wallet, creation / modification of wallet;
- **Batch Interface** : authorization request function.

Configuration

Web mode

Choice of default network

In the configuration screen of a payment method in the backoffice, the merchant defines brand to be used by default according to type of card.

More information on [Administration Center - Payment method](#) .

buyer choice

In this same screen, [the merchant must activate the functionality](#) to leave the choice to the buyer on payment pages.

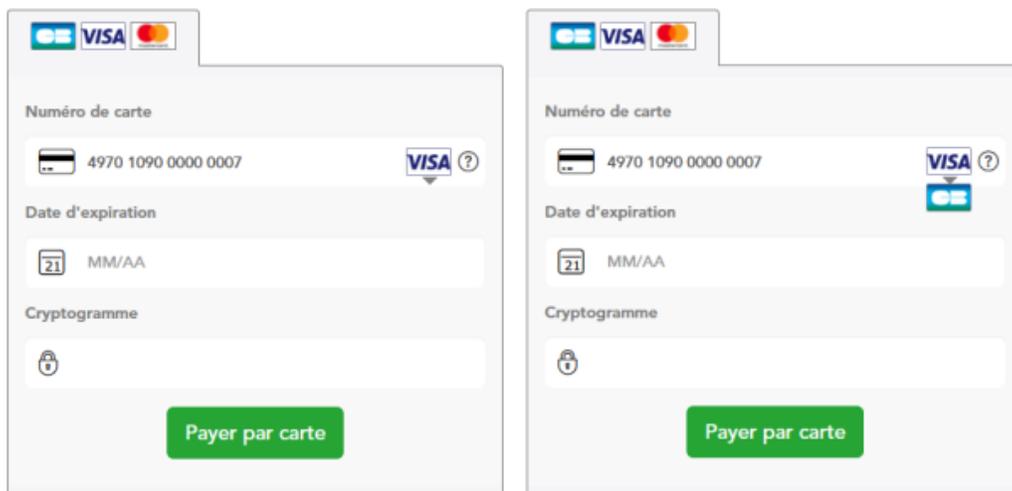

Brand management

 System automatically collects the consumer's favorite brand

Brand choice on payment pages

When the buyer enters card number, the payment form will automatically offer the choice as soon as the card number is recognized as being co-badged.

By clicking on the network logo, the buyer makes his choice of brand and selects his network.

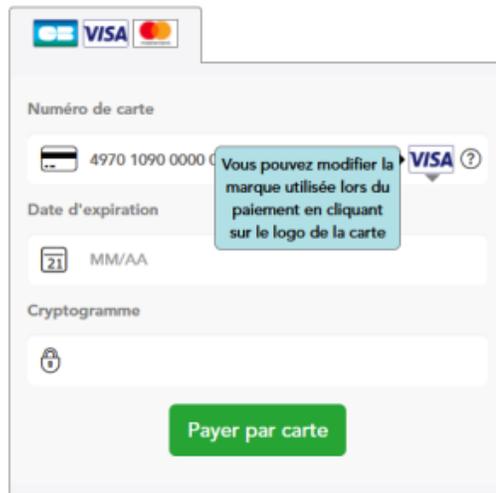

The image shows two side-by-side screenshots of a payment form. Both forms have a header with logos for American Express, VISA, and Mastercard. The left form shows a card number field with the number 4970 1090 0000 0007 and a VISA logo with a question mark. Below the card number is an expiration date field with a calendar icon and the text '21 MM/AA'. Below that is a cryptogram field with a lock icon. At the bottom is a green button labeled 'Payer par carte'. The right form is identical but shows the card number field with a dropdown menu open, displaying the American Express logo. The VISA logo with the question mark is no longer visible.

Note : If the merchant overloads the logos and / or user experience of payment widget, they must ensure that this does not alter the functionality.

Additional information ?

The European regulation imposes a precise and clear message that the buyer has to choose the brand.

Monext Online offers an icon with this information in WebPayment mode (lightbox, column, tab, PWPV2 redirect page).

The image shows a payment widget interface. At the top, there are logos for American Express, VISA, and Mastercard. Below these, the text "Numéro de carte" is followed by a card number field containing "4970 1090 0000". A tooltip with the text "Vous pouvez modifier la marque utilisée lors du paiement en cliquant sur le logo de la carte" points to a VISA logo with a question mark icon. Below the card number field is the "Date d'expiration" field with a calendar icon and "MM/AA" placeholder. Underneath is the "Cryptogramme" field with a lock icon. At the bottom is a green button labeled "Payer par carte".

Display mode overload

You can also override the display mode by **icon** by switching to a display mode by **an information text** below the card entry field.

You just need to add the *pl-other-brand-selection* css class in the PaylineWidget div to switch to the information text.

Example :

```
<div id="PaylineWidget" data-template="column" data-token="" data-expandAll="true" class="pl-other-brand-selection"></div>
```

In DirectPayment mode

In the DirectPayment API mode, the merchant displays the payment form and collects the information from the buyer. It must offer a way to allow the buyer to select the brand (CB, Visa, Mastercard).

The Monext Online APIs can be used to pass information relating to the choice in order to comply with the banking protocol point of view with the acquirers.

To do this, the choice made by the buyer must be transmitted by [filling](#) in the [cardBrand](#) field of the [Payment](#) and [Wallet](#) objects.
